

Prompt 1:-

I'll be going ahead with track 1, so help me build a roadmap through which I can complete the project,

My expertise lies in python, gradio, rag(langchain), machine learning, and a bit in deep learning(learned only till training multi layer perceptron)

and mongodb

Prompt 2:-

6. Hybrid RAG is one of your strongest technical points

what is a hybrid rag structure???

Prompt 3:-

Prompt 4:-

Let's start scraping data from websites, give me a list of websites from which I can scrape data

, or if there is any uci or kaggle dataset that I can refer. I'm expecting to have 40-50 data points.

Prompt 5 :-

I have found these kind of pdf from kohler website how can I use it to its fullest

Prompt 6:-

How can I start extracting data from this pdf?

Prompt 7:-

is there any api through which i can directly scrape data from pdf instead of using LLM extraction or vision models?

Prompt 8:-

As i don't have openai api key so i'll be using groq so lets stick to thjose model which lies in the groq fre end points

Prompt 9:-

Instead of maintaing different files lets first make jupyter notebook to test the model out then we will make

separate files for the project.

Prompt 10:-

Lets start extracting data from pdf , give me line by line code for the jupyter notebook.

Prompt 11:-

The vision model is not in the end point of the api key so can we try using ocr.

Prompt 12:-

The ocr is not working so lets skip the part of vision model and ocr , lets fabricate the dimensions and

price as we are working on a prototype.

Prompt 13:-

I'm making another directory for my retrieval part called retrieval now onwards all retrieval code will be in that folder

lets start writing code cell by cell

Prompt 14:-

I don't want to waste time making another environment lets use chromadb for semantic retrieval

Prompt:-15

Now that the recommendation system is working lets make different files to make the system work.
